

What if ... ?

Some commonly asked questions

What if the technology we use fails?

Chance of Failure

Chance of Failure

$$\text{Risk} = \text{Likelihood} \times \text{Severity}$$

Chance of Failure

$$\text{Risk} = \text{Likelihood} \times \text{Severity}$$

in unit

Time

Chance of Failure

$$\text{Risk} = \text{Likelihood} \times \text{Severity}$$

in unit

varies through

Time

Chance of Failure

$$\text{Risk} = \text{Likelihood} \times \text{Severity}$$

- As time tends to infinity so risk tends to 100%

Chance of Failure

$$\text{Risk} = \text{Likelihood} \times \text{Severity}$$

- As time tends to infinity so risk tends to 100%
- But severity may be unpredictable

Chance of Failure

$$\text{Risk} = \text{Likelihood} \times \text{Severity}$$

- As time tends to infinity so risk tends to 100%
- But severity may be unpredictable
- Not a helpful way to think of identifiers

Given long enough change is inevitable

Given long enough change is inevitable

Nothing lasts forever

Given long enough change is inevitable

Nothing lasts forever

Question is whether it will be replaced
by something compatible

Stability

Stability

Continuity = Usefulness x Ubiquity

Stability

People will replace something
that they need

Continuity = Usefulness x Ubiquity

Stability

People will replace something
that they need

$$\text{Continuity} = \text{Usefulness} \times \text{Ubiquity}$$

The more people use it
the more likely someone
is to produce a replacement

Stability

People will replace something
that they need

$$\text{Continuity} = \text{Usefulness} \times \text{Ubiquity}$$

The more people use it
the more likely someone
is to produce a replacement

(Could include simplicity)

- Depends on only two technologies
- Both Useful and Ubiquitous at the moment
- Both free and easy at the moment
- Both highly likely to continue in some form
- Both could be replicated within specialist community if needed
- ~ Difficult to think of an alternative?

What if I get a 5xx: Server Error?

5xx: Server Error

5xx: Server Error

- Bad things happen

5xx: Server Error

- Bad things happen
- We can't legislate against this

5xx: Server Error

- Bad things happen
- We can't legislate against this
- See discussion on institutional responsibility

5xx: Server Error

- Bad things happen
- We can't legislate against this
- See discussion on institutional responsibility
- What if the museum burns down or the staff don't turn up etc.

What if the data license changes?

Data License Change

Data License Change

- Just because you can access data today doesn't mean you can access it tomorrow

Data License Change

- Just because you can access data today doesn't mean you can access it tomorrow
- Supplier could just say "Insert your credit card number here"

Data License Change

- Just because you can access data today doesn't mean you can access it tomorrow
- Supplier could just say "Insert your credit card number here"
- Not our business - we just deal with identifying data not with access rights

What if the hosting institution fails?

Institution Failure

Institution Failure

- If the herbarium/museum ceases to exist then access to specimens is lost

Institution Failure

- If the herbarium/museum ceases to exist then access to specimens is lost
- It applies equally to physical specimens

Institution Failure

- If the herbarium/museum ceases to exist then access to specimens is lost
- It applies equally to physical specimens
- Collections could moved to other institutions - dealt with later

Institution Failure

- If the herbarium/museum ceases to exist then access to specimens is lost
- It applies equally to physical specimens
- Collections could moved to other institutions - dealt with later
- This is not our business

What if there is social failure within an institution?

Social Failure

Social Failure

- Management may not value the URIs and not resource their maintenance

Social Failure

- Management may not value the URIs and not resource their maintenance
- Ubiquity - the more institutions that do maintain identifiers the more pressure to maintain them

Social Failure

- Management may not value the URIs and not resource their maintenance
- Ubiquity - the more institutions that do maintain identifiers the more pressure to maintain them
- Usefulness - you don't kill something you need

Social Failure

- Management may not value the URIs and not resource their maintenance
- Ubiquity - the more institutions that do maintain identifiers the more pressure to maintain them
- Usefulness - you don't kill something you need
- We can't do anything about this other than build a good system and promote it

What if a collections merge or split?

Collection Migration

A collection moved to another institution but the institution continues to exist

Institution Merging

A collection moved to another institution as the original institution disappears

Collection Splitting

A collection is split between two institutions

Complex Splitting

Part of a collection moves to a different institution

Handling Movement

Handling Movement

- If both institutions have issued HTTP URIs and continue to exist then split is handled in data OR domain/sub-domain is passed with collection

Handling Movement

- If both institutions have issued HTTP URIs and continue to exist then split is handled in data OR domain/sub-domain is passed with collection
- If donating institution ceases to exist then domain must be passed with collection

Handling Movement

- If both institutions have issued HTTP URIs and continue to exist then split is handled in data OR domain/sub-domain is passed with collection
- If donating institution ceases to exist then domain must be passed with collection
- Generally merging involves big collections absorbing orphaned collections - so this is probably not a problem.

What if we use a third party supplier?

Alternative Use of GUID Services

Alternative Use of GUID Services

GUID
Supplier

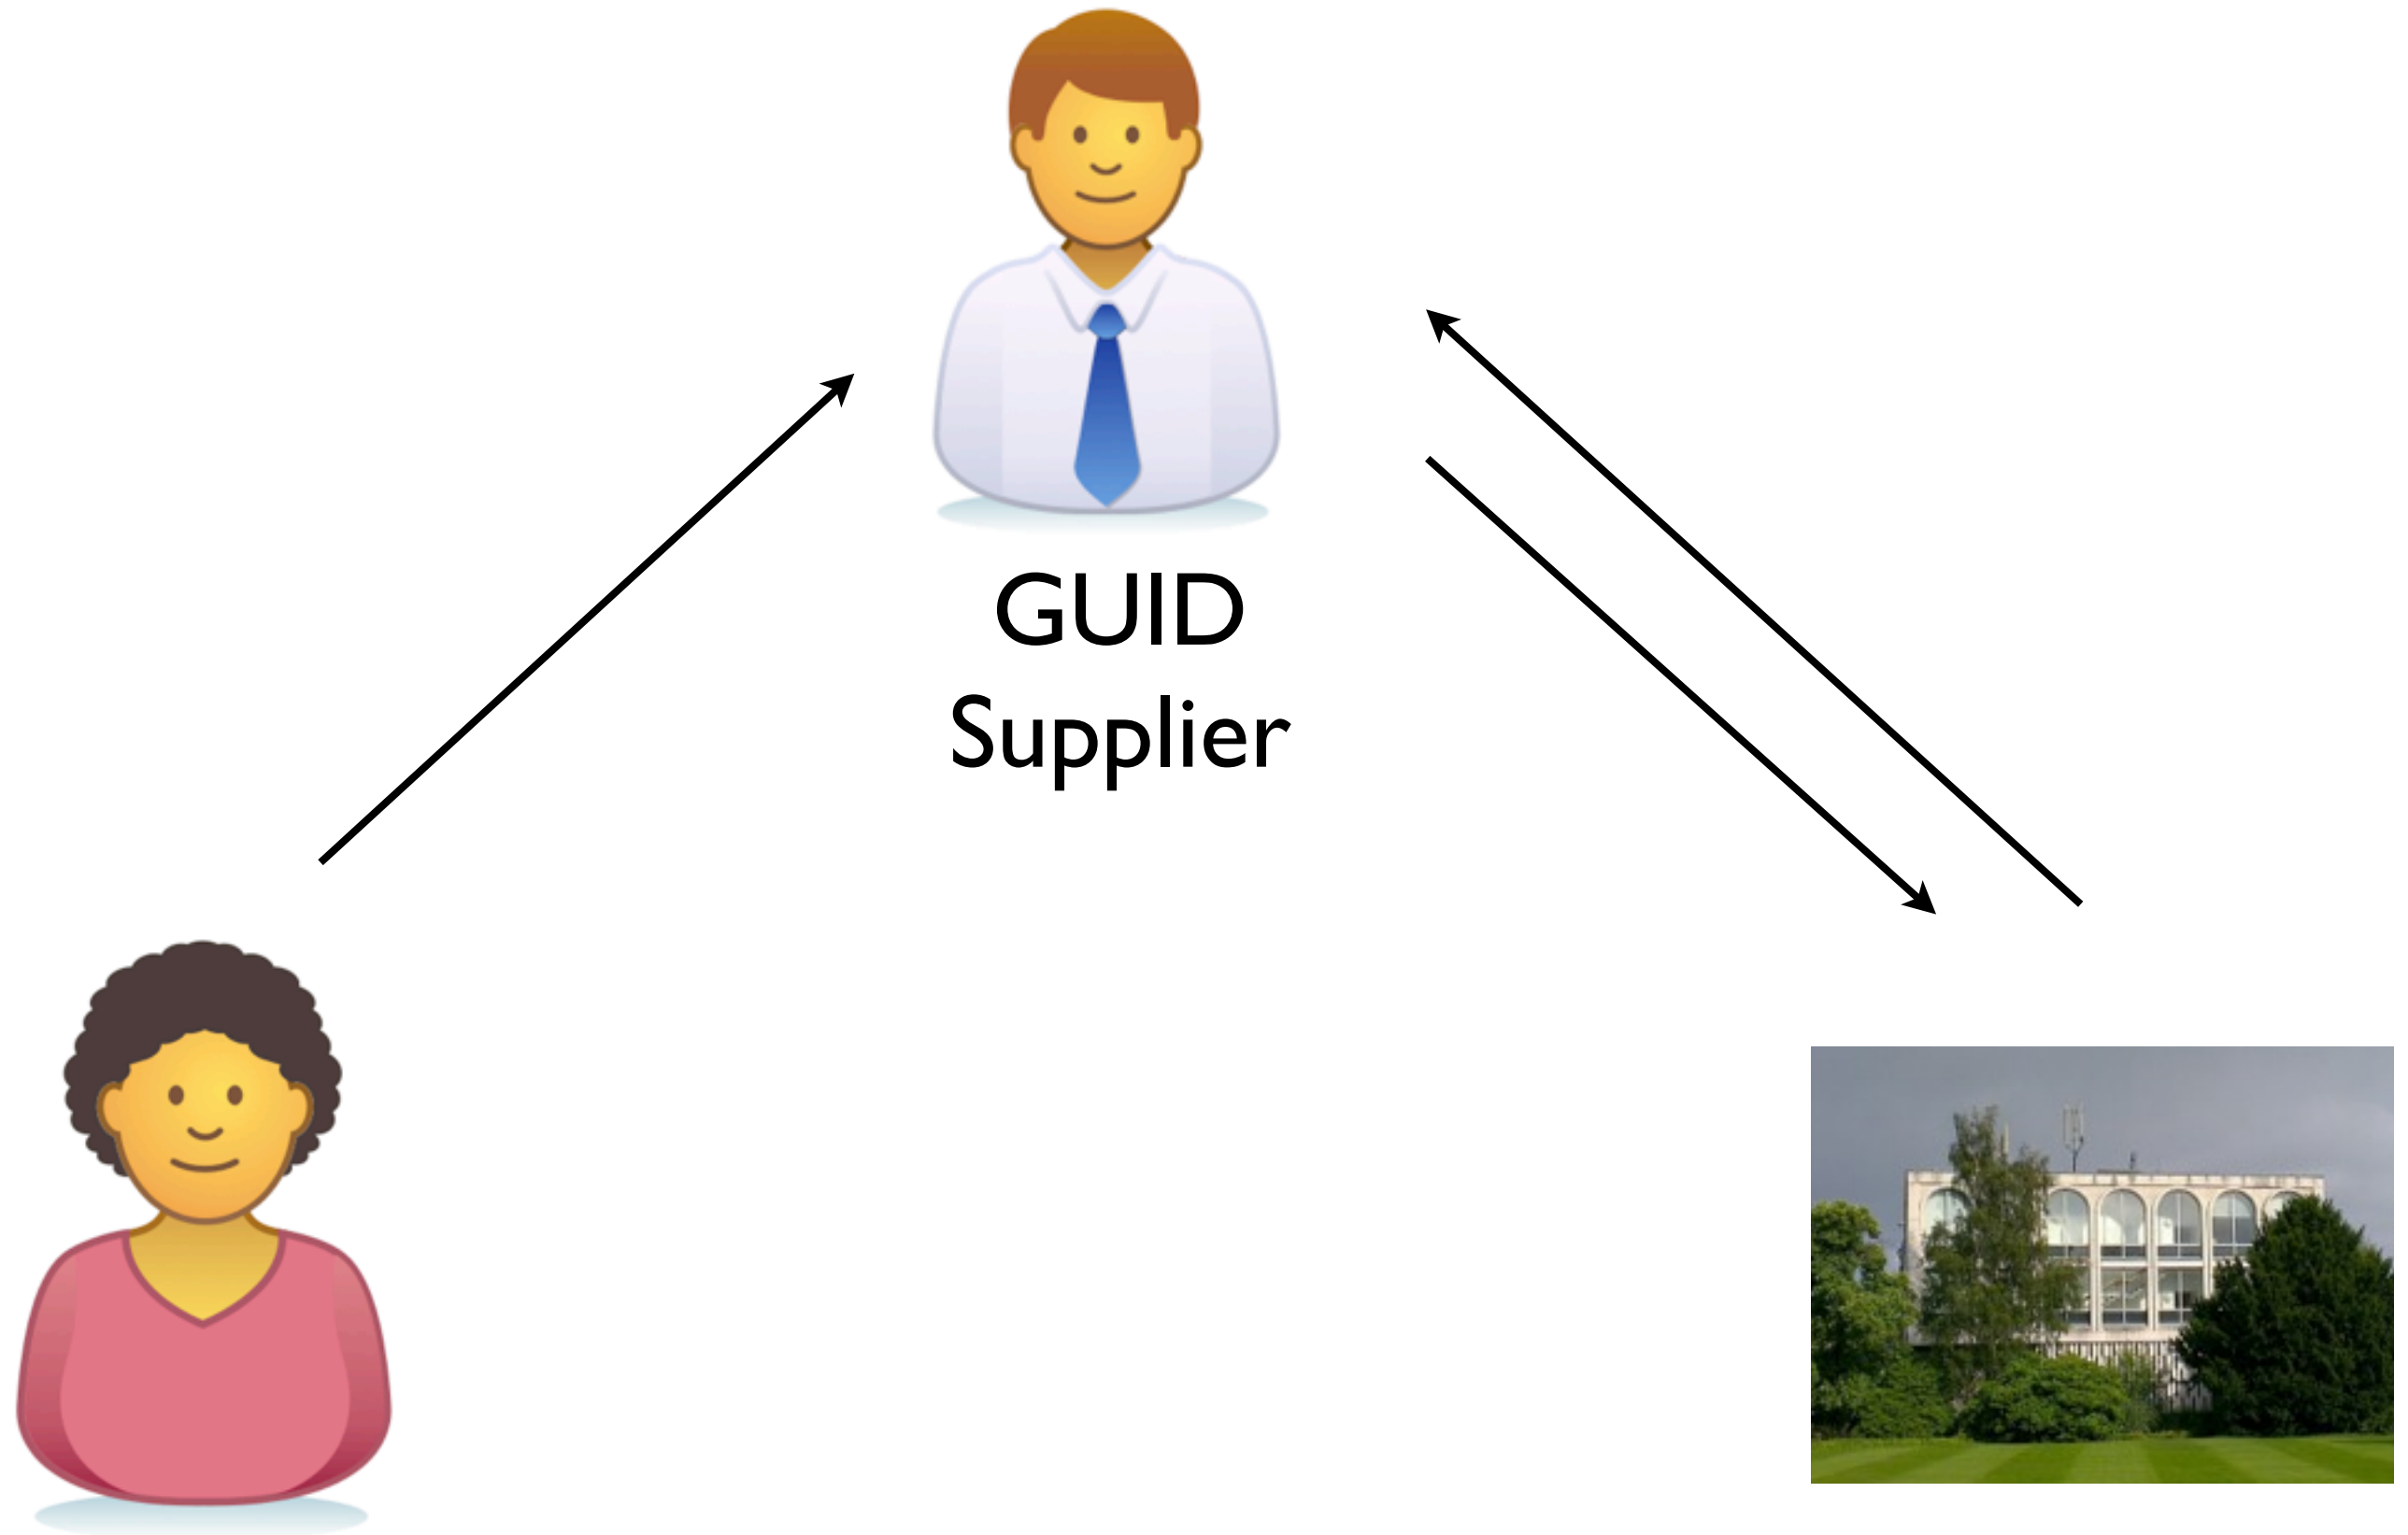

Alternative Use of GUID Services

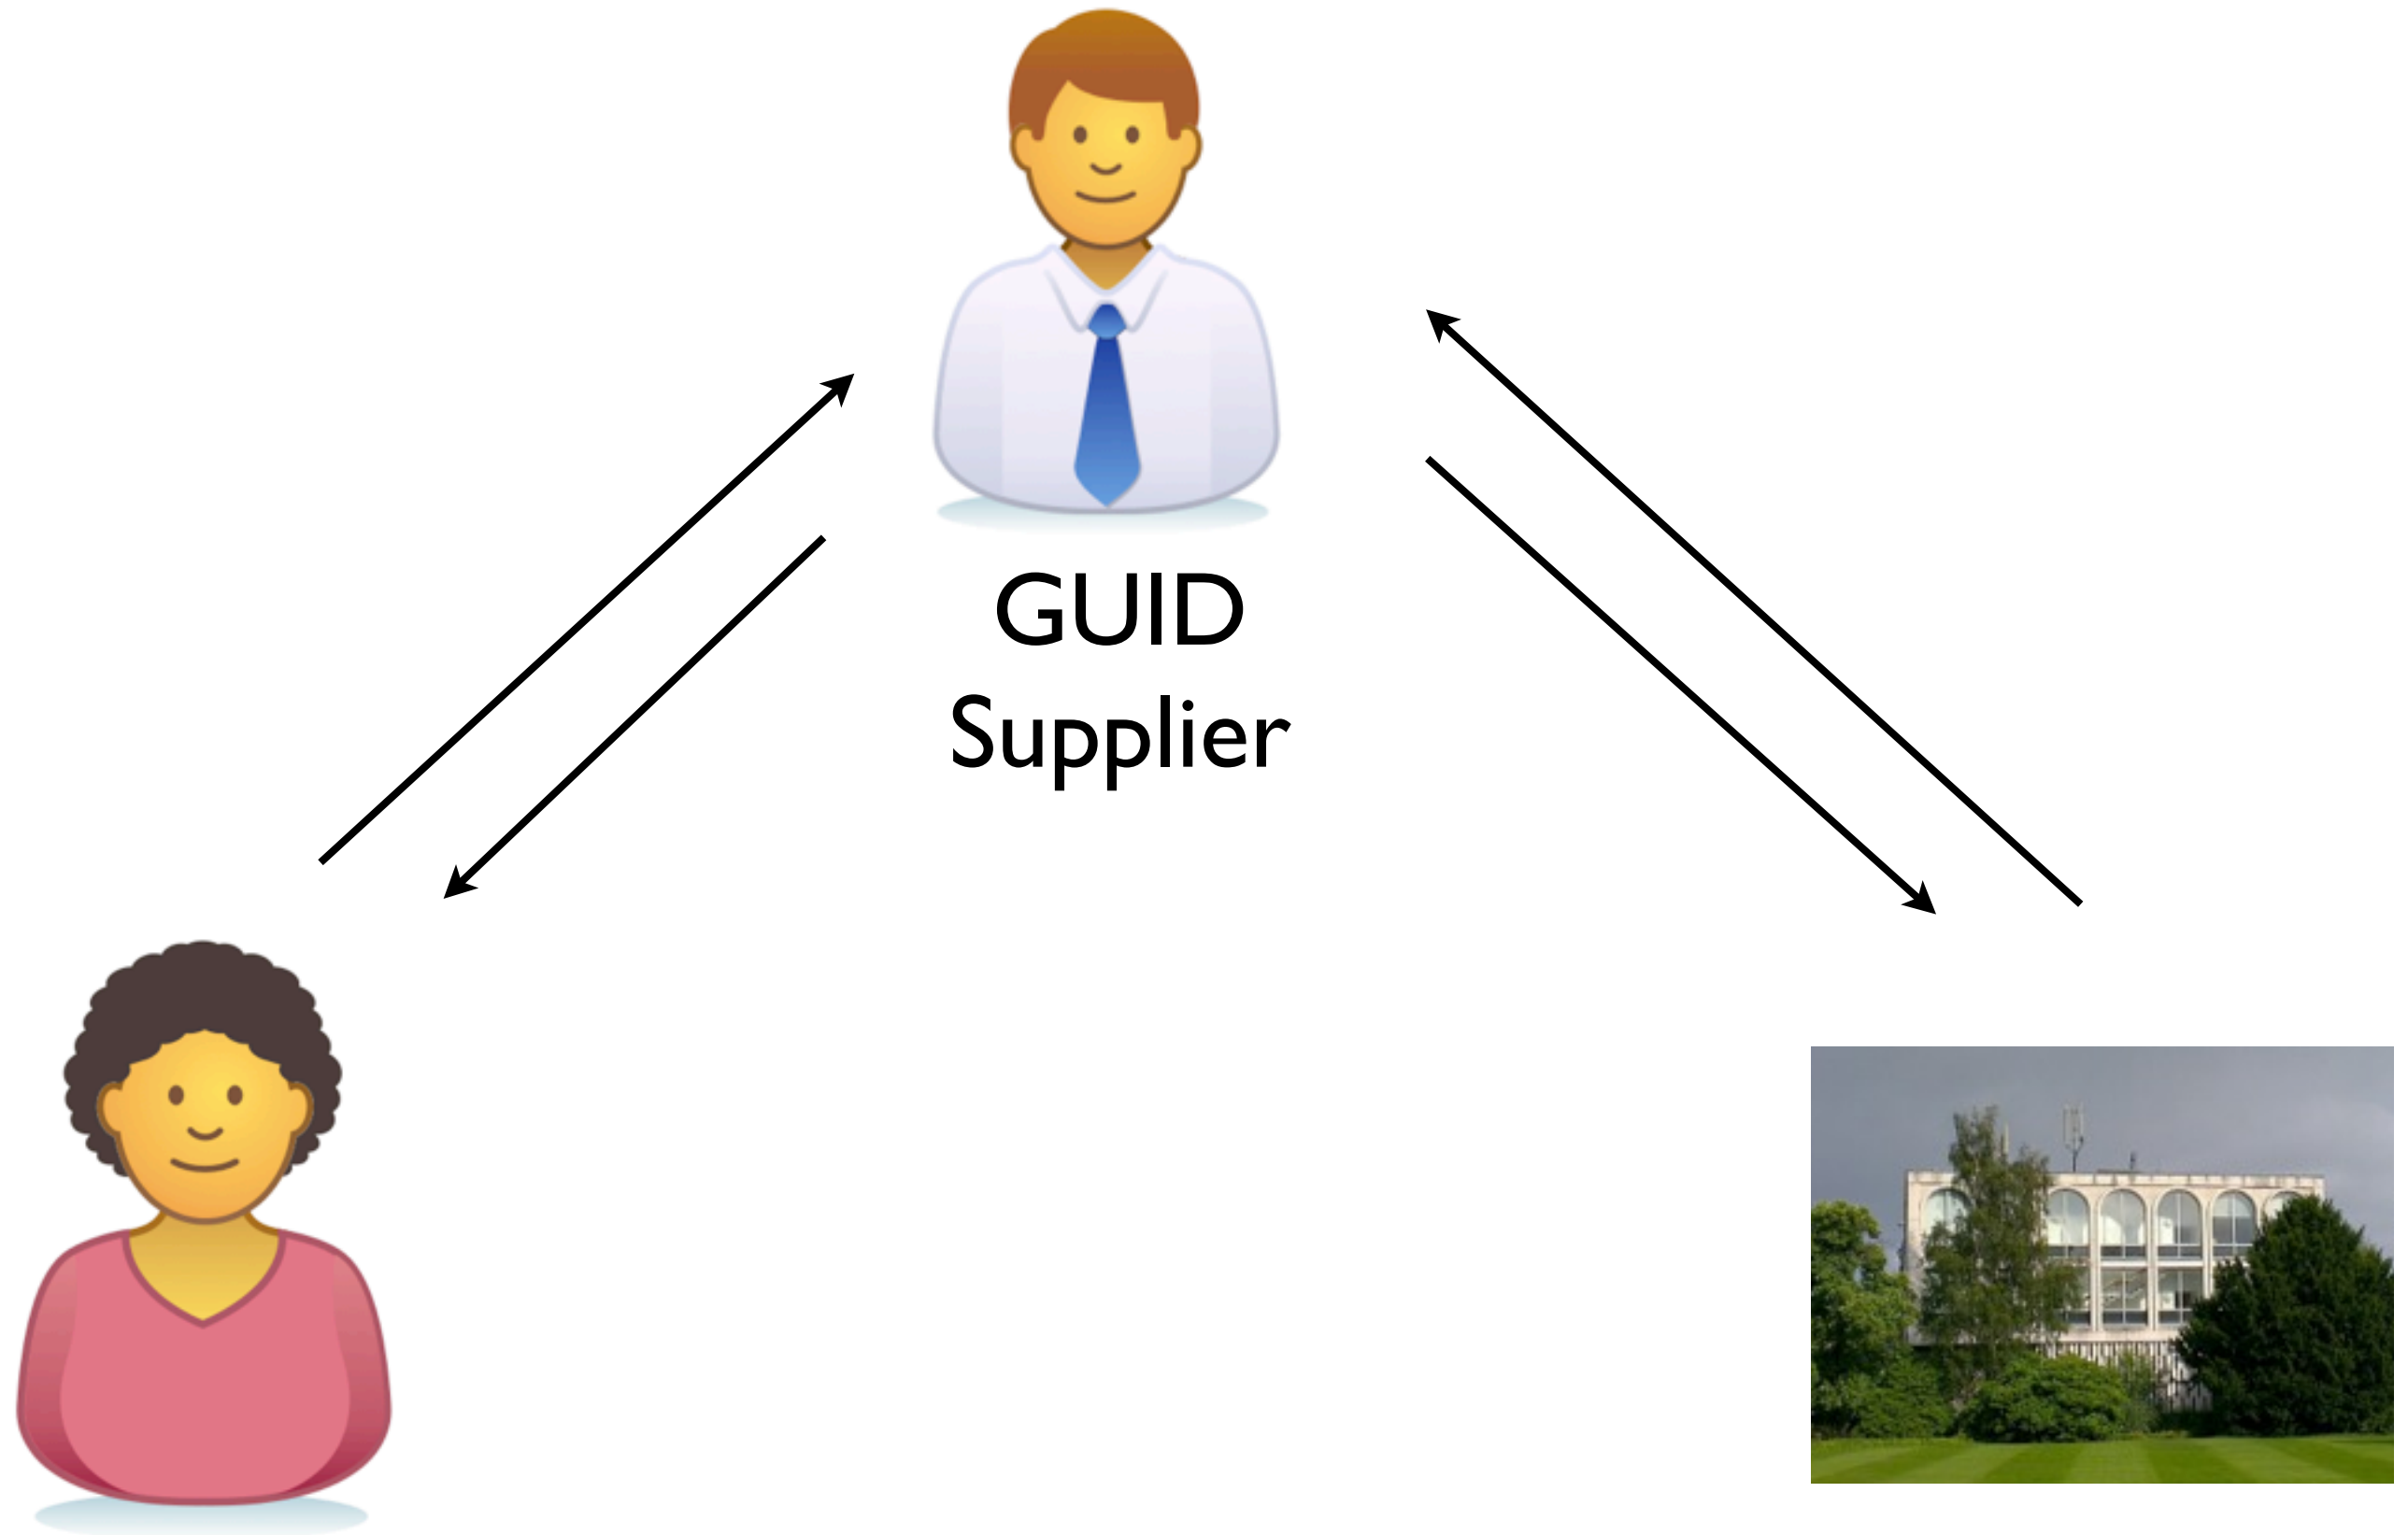

GUID
Supplier

Alternative Use of GUID Services

Alternative Use of GUID Services

Alternative Use of GUID Services

GUID
Supplier
